Contacting Gemini model (attempt 1)...

LLM Response:
In simple words, **Artificial Intelligence (AI)** is when we teach computers and machines to **think and learn like humans**.

Here is an easy way to understand it:

### 1. The Difference Between Normal Computers and AI
* **A normal computer program** is like a rigid recipe. It can only do exactly what it is told to do. If you tell it to add $2 + 2$, it gives you $4$. If it runs into something it wasn't prepared for, it get
s stuck.
* **AI** is more like a human child. Instead of giving it strict rules, we show it millions of examples, and it **learns on its own**.

> *Example:* If you want an AI to recognize a cat, you don't write rules describing whiskers and ears. You simply show it 100,000 photos of cats. The AI figures out what makes a cat a cat, and then it can re
cognize a cat it has never seen before.

---

### 2. Examples You Use Every Day
You probably already use AI without realizing it:
* **Netflix or Spotify:** When they suggest a movie or song you might like, AI is studying your past choices to guess your taste.
* **Siri, Alexa, or Google Assistant:** AI understands the sound of your voice and figures out the answer to your question.
* **Maps (Google Maps / Apple Maps):** AI looks at traffic patterns to predict the fastest route to your destination.
* **Spam Filters:** Your email uses AI to spot junk mail and throw it in the trash automatically.
* **Face Unlock:** Your phone uses AI to recognize your face, even in the dark or if you put on glasses.

---

### Summary
**Artificial Intelligence is simply software that can learn, spot patterns, and make decisions without a human having to guide every single step.**
